Transitional Buffer Seed Mix (Dry-Mesic Soils)

MIX STATISTICS		
Average Mix Height (ft)	1.9	Designed as a short-grass native planting that can be installed between low, flat areas (turf grass areas, sidewalks, etc.) and the taller, more diverse prairie areas. This transitional short-graminoid mix has multiple applications. First, it provides space so that taller plants will not flop onto the lawn or pavement, and a visual screen to the lower, less attractive portion of the prairie. Second, it is easy to maintain with standard broad leaf herbicides, which gives a neat, "cared for" appearance that establishes a defined edge to the prairie. Third, it establishes an all-graminoid buffer between lawn and prairie that will protect the broadleaf wildflowers in the prairie from annual "weed-and-feed" applications (which contain a broadleaf herbicide) to the lawn. The grasses in this mix are warm-season grasses, which means they will go dormant (turn golden brown) in the fall. Seeding of this mix should only occur in spring (typically before June 15th).
Median Mix Height (ft)	1.3	
Species Heights (# of Occurrences in Mix)	0.5' (1), 2' (1)	
Number of Native Species in Mix	2	
Native FQI	2.8	
Native Mean C Value	4.0	
Native Mean W Value	5.0	
National Wetland Category	UPL	
Lbs/Acre of Native Seed	65.0	
Seeds per Square Foot	138.8	
Percent of Mix (by Seed Count) Requiring Stratification	0.0%
